Insignificant Figures

- “My data doesn’t matter to anyone else.”
- Geospatial data can be visibly insignificant -
pause for electron microscopists to calm down - due to
common coordinate systems allowing easy
overlay with other spatial data

Insignificant Figures

Dispersal, home-range size, and habitat use of an endangered **land snail**, the Oregon forestsnail (*Allogona townsendiana*)

“To investigate the dispersal distances and habitat-use patterns of Oregon forest snails, we tagged and tracked 21 adult snails at Langley, British Columbia, for up to 3 years (2005-2008). The maximum daily dispersal distance for a snail was 4.5 m and the maximum displacement that we observed for a snail was **32.2 m** during 3 years. Snails occupied home-range areas of **18.4-404.4 m²**, often overlapping both forest and meadow habitat.”

Edworthy, Amanda & Steensma, Karen & Zandberg, H & Lilley, Patrick. (2012). Dispersal, home-range size, and habitat use of an endangered land snail, the Oregon forestsnail (*Allogona townsendiana*). Canadian Journal of Zoology. 90. 875-884. 10.1139/Z2012-056

Particulates Matter

- “Only volume and scale count!”
- Your data is the medium, not the container
 - Lego blocks,
 - not Lego kits

Particulates Matter

Smithsonian Releases 2.8 Million Images Into Public Domain

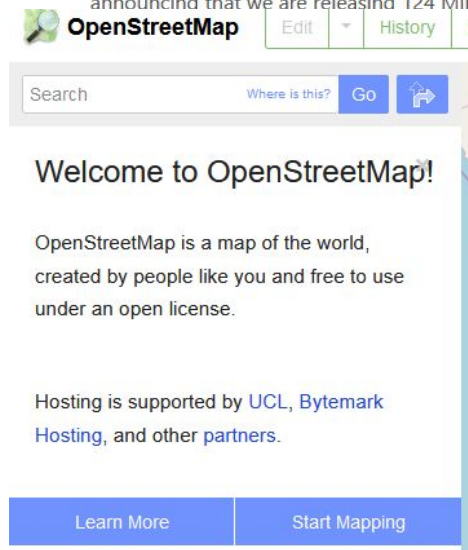

The launch of a new open access platform ushers in a new era of ac-

- You don't need to be a corporation or join a project and produce data in bulk for it to be of value.
- *Pause for astrophysicists, climatologists and bio-geneticists to calm down.*

2018

Microsoft Releases 125 million Building Footprints in the US as Open Data

Bing has made very significant investments in the area of deep learning, computer vision and artificial intelligence to support a number of different search scenarios. The Bing Maps team has been applying these techniques as well with the goal to increase the coverage of building footprints available for [OpenStreetMap](#). As a result, today we are announcing that we are releasing 124 Million building footprints in the United States to the OpenStreetMap

Mapping our world together

WHAT WE DO OUR WORK TOOLS & DATA NEWS

HOT is an international team dedicated to humanitarian action and community development through open mapping.

Learn about what we do

Get involved

Particulates Matter

- [Everything counts \(in large amounts\)](#)
- FAIR data accumulates faster than you think

Volume of data on Figshare Infrastructure

Sift Data

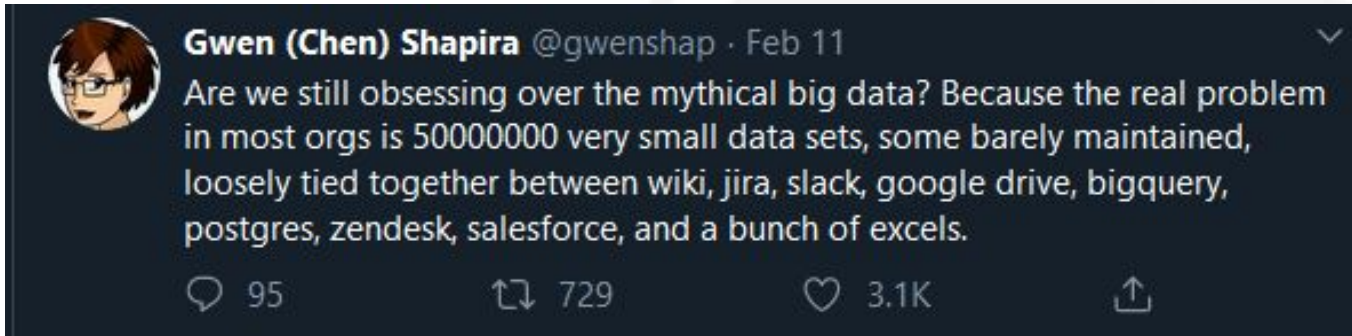

- Spatial data accumulates even faster than non-spatial data due to the locational component - *everything happens somewhere.*
- This allows [serendipitous discovery](#) without subject specific search relevance
- Locations allow overlay and amalgamation at many scales

“GIS-enabled applications are thus especially valuable for almost all GEO data, although they are not discussed separately here” [The Value of Open Data Sharing GEO Report, 2015](#)

“If we pull this off, we’ll eat like kings.”

Bank Leafs

- Fragile spider webs of data exist within and between individuals and organisations
- FAIR policies and processes allow accretion of data beyond subject specific boundaries
- Disconnecting the concept of research outputs as strictly final publications vastly increases accessibility and survivability of data

“However, long-tail models only work when there is sufficient content to occupy the tail. In order to achieve this scale of content in a sustainable manner, the outputs listed above need to become a frictionless by-product of the standard practice, rather than the outcomes of isolated projects.”

[Weller, M; 2011: The Digital Scholar](#)

Ethical Dots

- Locational data may be too sensitive to share directly
- [POPIA](#)! [GDPR](#)! [Ethics](#)! Oh My!
- Obfuscation:
 - Nearest Place Assignment
 - Rounding Coordinates
 - Clustering techniques
- Use platforms with tiered access levels

Uniform Obfuscation for Location Privacy

Ethical Dots

- Data resists anonymisation

“Using our model, we find that 99.98% of Americans would be correctly re-identified in any dataset using 15 demographic attributes.”

[Rocher, L., Hendrickx, J.M. & de Montjoye, Y. Estimating the success of re-identifications in incomplete datasets using generative models. *Nat Commun* 10, 3069 \(2019\). <https://doi.org/10.1038/s41467-019-10933-3>](https://doi.org/10.1038/s41467-019-10933-3)

Convenience Costs

- [FAIR != Open Data](#), T&C's apply and add the cost of administering and policing TOU's
- Convenience Counts - Ease of access, search and sharing are strong attractors.
- [Clean](#) Open Data is enormously valuable
- [Natural Earth](#) & [WorldCLIM](#) underpin many basic maps by UCT researchers.

Natural Earth is a public domain map dataset available at 1:10m, 1:50m, and 1:110 million scales. Featuring tightly integrated vector and raster data, with Natural Earth you can make a variety of visually pleasing, well-crafted maps with cartography or GIS software.

Natural Earth was built through a collaboration of many volunteers and is supported by NACIS (North American Cartographic Information Society), and is free for use in any type of project (see our [Terms of Use](#) page for more information).

- For Now ...

“AI technologies have the potential to foster an inclusive science community. But a good AI is dependent on the variety and quality of data. Open data can play a key part for AI algorithms and machines to function and produce good outcomes²⁷.”

[Burgelman Jean-Claude, Pascu Corina, Szkuta Katarzyna, Von Schomberg Rene, Karalopoulos Athanasios, Repanas Konstantinos, Schouppe Michel, 2019: Open Science, Open Data, and Open Scholarship: European Policies to Make Science Fit for the Twenty-First Century; DOI: 10.3389/fdata.2019.00043](#)
