

The data used in the 2019 initial sardine assessment

de Moor, C.L.[#], Coetzee, J.⁺, Merkle, D.⁺ and van der Lingen C.D.⁺

Correspondence email: carryn.demoor@uct.ac.za

Data to which the 2019 initial assessment of the South African sardine resource is to be conditioned are listed.

Summary

This document provides tables of data¹ to which the South African sardine initial assessment is to be tuned. The document is brief, providing updates of tables from de Moor *et al.* (2016). Unless otherwise specified, the manner in which the data are analysed and refined prior to use in the assessment remain unchanged from that of de Moor *et al.* (2016). A more comprehensive document of data to be used both sardine and anchovy assessments is planned for later in 2019. Given the urgency with which the initial sardine assessment was required, some of the data in these tables are not final (see, in particular, the footnotes). The data will be finalised for the comprehensive document.

- The monthly tonnage of directed sardine catch and sardine bycatch with round herring is shown by area in Tables 1a and 1b. The monthly tonnages of sardine bycatch with anchovy are given in Table 1c.
- The juvenile catch assumed taken prior to the start of the survey, together with the associated survey start date and survey recruit cut-off lengths are given in Table 2.
- The time series of total biomass estimates and associated CVs from the acoustic surveys in November each year, corresponding to the standard survey area between Hondeklip Bay and Port Alfred, are given in Table 3.
- The time series of recruit biomass and numbers and associated CVs from the May/June recruit surveys is given in Table 4.
- The time series of infection prevalence of the “tetracotyle” type digenean endoparasite by length as sampled from November surveys between 2010 and 2016 and 2018 is given in Table 5 (van der Lingen and Petersen 2019).

Table 4. Sardine recruitment (in tons and numbers in billions) from Hondeklip Bay to Cape Infanta and associated CV from the recruitment acoustic survey. The mean recruit weight is also given (in grams). The sardine recruitment and associated CV from Cape Infanta to Cape St Francis is also given for some years. Blank cells correspond to years/areas for which data are not available, e.g. the survey did not reach Cape St Francis.

Year	West of Cape Infanta					Cape Infanta to Cape St Francis

2018										

⁴ The 1985 survey area included a single stratum from east of Danger Point to Mossel Bay. This full area is included in the survey estimate and thus the estimate is higher than that which would correspond to a survey area west of Cape Infanta only. It is thus not strictly comparable with the rest of the time series, but given the low survey estimate, it is considered acceptable for this assessment.

⁵ Biomass and numbers west of Cape Infanta should be estimated by taking that observed up to east of Danger Point and increasing by 0.038. This increase factor was the average 1991-5,1998,1999 ratios of numbers of recruits surveyed between Cape Agulhas-Cape Infanta to those surveyed west of Cape Agulhas, and thus the resultant values will be underestimates of that present for the full area west of Cape Agulhas. The CV should also be adjusted according to the method of de Moor and Butterworth (2011), but there was insufficient time to undertake this analysis before the initial assessment. Additionally, the above numbers were mistakenly adjusted twice. This will be corrected in the comprehensive data document planned for later during 2019.

⁶ Some recruit numbers from 2005-2015 have been updated since de Moor *et al.* (2016), following a change in the cut-off length. The CVs for 2005 and 2006 used in the initial assessment only account for inter-transect variance and not the additional variance for the update to the timeseries to account for uncapped estimates and attenuation.

⁷ Biomass and numbers west of Cape Infanta were estimated by taking that observed up to Cape Agulhas and increasing by 0.03 (de Moor and Butterworth 2011). The 0.03 proportion was based on an old timeseries of data, but there was insufficient time to update the analysis of de Moor and Butterworth (2011) before the initial sardine assessment.

Table 5a. The number of sardine sampled by length class for the “tetracotyle” type digenean endoparasite, west and east of Cape Agulhas (note that data for samples east of Cape Agulhas excludes those collected between 20 and 22°E).
